

PTC Industries offers a wide variety of electrically operated gates, from the basic AG50 Push button gate to the SAG100 Manual Security Gate.

AG50 Gate may be equipped with the Directional Logic Control, Vehicle Detectors and the C411 Card Reader to allow unattended control of virtually any parking or controlled access situation. Other options include:

Safety Edge Package - raises gate if a vehicle is struck.

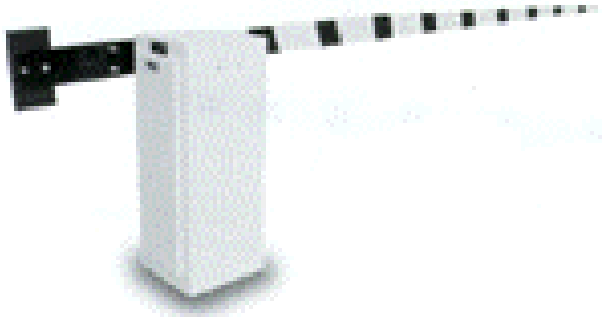

Folding Gate Arm - for inside operation.

Radio Controls - for remote entry.

Count Package - to prevent overloading of lot

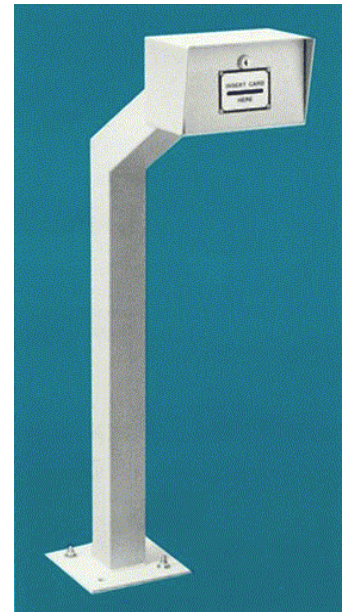

The SAG70 and SAG100 Security Gates are available for areas which may have entrances wider than the standard 10 feet.

Cabinet

Gate Cabinets are fabricated from 12-gauge steel, dichrome plated throughout to maintain a long-lasting weather tight, rust resistant service life. All structural seams are welded at the corners to assure structural integrity. The shafts are centered within the cabinet by self-lubricating bushings. Access to the inside is provided by a single gasket door with a flush mounted T-handle lock assembly.

Electrical Operation

All logic controls are provided in a factory sealed enclosure. All operational controls are of relay logic design and incorporate a plug-in style wiring harness to the connection box for easy field service and/or lane modification. The adjustment of gate arm travel is by limit switch and cam assemblies, so that no brake devices are necessary.
