

The Patrol Manager Watchmans Clock is a simple, easy to use electronic watchclock system.

A basic DETEX Patrol Manager System contains a series of **DATA STRIPS** located where you would normally locate KEY STATIONS. Each strip has an embedded number, which can only be read by the DAU. The DAU is swiped across the DATA STRIP.

DATA STRIPS

The **DATA ACQUISITION UNIT (DAU)** is used to "READ" the DATA STRIPS. It can be carried in the pocket, holster, or on a safety chain. The DAU is swiped across each DATA STRIP transferring the strip number into the DAU memory. The time of each swipe is also stored. When all the DATA STRIPS have been read, the DAU is placed into the DTU to transfer the tour data to the printer.

**ESCORTE
DATA ACQUISITION UNIT**

DATA TRANSFER UNIT

After the rounds are finished, supervisory personnel issue the proper commands to the DAU and place it in the **DATA TRANSFER UNIT (DTU)**. The DTU is used to transfer the Tour Data from the DAU to a PARALLEL PRINTER.

Systems that transfer to a Computer are also available.
